

PM Tracker

PM Tracker is a flexible project management tracking tool that helps project managers to track task assignment in their project. As companies expand across geographical boundaries, the need to coordinate tasks between the users working together increases.

The PM Tracker is a suite of project management components which includes Task Assignment, Calendar, Personal Schedule, Notes, Announcements, Gantt Charts and more. The power of project management comes in when these individual components are shared and used within a team. PM Tracker allows user to create a multiple task assignments that are shared between the team members in a single shot.

Database

PM Tracker uses the **HSQL** database engine for persistent storage of data. Also, as HSQL stores all data in-memory (operations logged to disk in case of failure), there is an upper cap on the amount of data that can be stored. Currently we are not supporting migration of another database. If you need support for some enterprise database kindly contact pmtracker@gmail.com

Product Benefits:

- Multi-purpose project management suite.
- Flexible Project Management
- Used for multiple purposes
- Location, Browser, Machine Independent
- Clean Interface
- Runs on both Windows/Linux machines
